

HEALTH PLANS

Explore More Ways to Maximize Your California Health Data Resource

Access high-resolution, whole person health data from one central source with the largest nonprofit health data network in our state.

California health plans rely on Manifest MedEx (MX) as their high-resolution data partner for better-coordinated, more efficient care.

MX's nonprofit health data network has grown by more than 40% in just the last three years — with significant scaling of longitudinal clinical and claims information and hard-to-reach social drivers of health (SDOH) and behavioral health data.

LONGITUDINAL
HEALTH RECORDS

ADTs

Real-time hospital event notifications to help members get the care they need, right away.

HEDIS®

NCQA-validated data to improve quality scores and reduce reporting burden.

Enhanced Data

Local and missing codes mapped to standard code sets for more accurate, usable data.

DxF Compliance

QHIO designation for the CalHHS DxF program.

Risk Adjustment

Easy-to-consume clinical chart notes to simplify risk adjustment.

How Manifest MedEx Supports Health Plan Success

MX provides the actionable insights health plans need to manage population health and improve member outcomes. By securely bringing together clinical, claims, behavioral health, and social drivers of health (SDOH) data, MX bridges the gap between fragmented silos and whole person health.

With data from MX, leading California health plans have been able to improve care, enhance coordination, and increase efficiency.

Post-discharge follow-up

Using real-time admit and discharge notifications from MX, a health plan streamlined post-discharge follow-up and saved staff time:

- Reduced outbound calls to hospitals by approximately 15% to 20% per month
- Saved 9.7 staff hours per day by making fewer calls to hospitals

HEDIS® performance

A health plan participant improved its HEDIS performance using data from MX::

- 16.5% increase in the administrative rate for Comprehensive Diabetes Care (CDC) HbA1c testing. MX was the second-largest source of A1c data, behind only Quest Diagnostics.
- 8.2% increase in the administrative rate for Controlling High Blood Pressure (CBP)
- 4.8% increase in the administrative rate for Childhood Immunization Status (CIS)
- 3.7% increase in the administrative rate for Lead Screening in Children (LSC)

Chart chases

Member-level data from MX helped one health plan meet HEDIS requirements with far less manual record review:

- Decreased chart chases by 54% (prior to working with MX, the team conducted 26,000 chart chases, representing 13,000 hours of work by contract nurses to close gaps in data.)
- With more complete data, nurses spent less time combing through health records and more time with members, and local providers gained confidence in the plan's care gap reports.
